

Knowledge Taxonomy Standard Operating Procedure

Meridian Industrial Group | Document Management Division

Document ID:	MIG-SOP-KT-2025-007
Classification:	Internal
Effective Date:	March 1, 2025
Supersedes:	MIG-SOP-KT-2024-003 (Rev. 1)
Owner:	Knowledge Management Office
Approved By:	R. Chen, Director of Information Architecture

1. Purpose

This procedure defines the standard process for classifying, naming, and indexing organizational documents within the Meridian Knowledge Repository. Adherence to this procedure ensures consistent retrieval, reduces duplication, and supports the organization's transition to AI-assisted document intelligence capabilities.

2. Document Type Taxonomy

All documents entering the Knowledge Repository must be assigned exactly one primary type from the controlled vocabulary below. Documents spanning multiple types shall be classified by their primary function.

Type Code	Category	Description
POL	Policy	Governing directives, compliance frameworks, organizational mandates
SOP	Standard Operating Procedure	Step-by-step process instructions for repeatable operations
TRN	Training Material	Instructional content, onboarding guides, certification curricula
RPT	Report	Analysis output, audit findings, performance summaries
MEM	Memorandum	Internal communications, directives, leadership correspondence
SPE	Specification	Technical requirements, engineering standards, system configurations
CON	Contract	Agreements, service-level documents, vendor arrangements
REF	Reference	Lookup tables, glossaries, code listings, directory information

3. Standard Naming Convention

All documents must be renamed upon ingestion according to the following pattern:

[ORG] - [TYPE] - [SUBJECT] - [YYYY] - [SEQ]

- **ORG:** Organization abbreviation (e.g., MIG for Meridian Industrial Group)
- **TYPE:** Three-letter type code from the taxonomy table above
- **SUBJECT:** Concise subject descriptor using hyphens, no spaces (e.g., Data-Governance)
- **YYYY:** Four-digit year of document creation or last major revision
- **SEQ:** Three-digit sequential number assigned at ingestion (e.g., 001, 002)

Example: MIG-POL-Data-Governance-2025-041 represents the 41st document ingested in 2025, classified as a Policy with the subject Data Governance.

4. Ingestion Workflow

Step 1: Upload

The submitter uploads the document through the Document Intelligence Engine intake portal. Accepted formats are PDF, DOCX, and TXT. Maximum file size is 10 MB per document.

Step 2: Automated Classification

The system's classification service analyzes the document content and assigns a recommended document type, subject descriptor, and confidence score. The classification method (simulated or AI-driven) is recorded in the audit log.

Step 3: Human Review

A designated reviewer examines the classification in the staging queue. The reviewer may approve the classification as-is, modify the document type or subject fields (which triggers automatic recalculation of the standard name), or reject the document with a stated reason. All actions generate audit log entries.

Step 4: Repository Promotion

Upon approval, the document is promoted to the Knowledge Repository where it becomes searchable, browsable by category, and available to authorized personnel according to the access controls defined by its classification tier.

5. Audit and Traceability

Every action taken on a document from ingestion through repository storage is recorded in an append-only audit log. This log captures the timestamp, action type, actor identity, document reference, and relevant metadata changes. The audit log is immutable and retained in accordance with the organization's records retention schedule (minimum five years). Quarterly reviews of the audit log are conducted by the Knowledge Management Office to identify classification accuracy trends and process improvement opportunities.
